

BACKGROUND

In response to more frequent and extreme flooding events impacting communities along the Brandywine Creek in both Pennsylvania and Delaware, the Brandywine Conservancy is excited to announce the launch of the Brandywine Flood Study—nearly two years after Hurricane Ida produced historic flooding that devastated the region. Conducted in partnership with the Chester County Water Resources Authority (CCWRA) and the University of Delaware Water Resources Center (UDWRC), the flood study is a coordinated effort to better understand where and why flooding occurs and identify the best approaches to protect our communities from future severe flooding events.

GOALS

- Reduce flooding to the main stem of the Brandywine Creek in Pennsylvania and Delaware
- Coordination with Delaware flood mitigation efforts
- Identify projects for flood attenuation, including pilot projects on Brandywine Conservancy-owned properties that may serve as models for watershed-wide sites
